

In the near future, parking lots and toll booths along highways will also get smart and you'll no longer have to stop at toll booths. As you travel along the road, a camera will capture your car's license plate and send a monthly bill of your toll expenses to your home (So beware when lending your vehicle to people).

Closer home also, with time our surroundings will grow intelligent enough to save electricity and perform human tasks. Besides monitoring and maintaining the temperature in our houses and cleaning it, devices will also be able to monitor our sleep and wake us up when it's scientifically the right time to wake up.

A solution to power Shortage / outage problem

So, in a couple of years when you turn on your TV, the blinds will automatically close themselves to block sunlight and allow you to watch your favourite match. Naturally, your next question must be: "How soon can we expect this?" It depends on you really. You could be one of the creators of this next technology revolution and help accelerate its development.

Where do you begin building the Internet of Things?

Fire is the first revolutionary discovery that led to the progress of mankind. Then came the revolution in science (physics, maths and chemistry) that gave us electricity and electronics, which was then followed by the computer revolution. We don't exactly know for sure what the NEXT BIG THING exactly will be, else we would have created it ourselves. But Brian Krzanich, the CEO of computer chip manufacturer Intel, bets on the 'Maker' revolution. And naturally, Intel is creating products that will help the maker community build the Internet of Things.

You could start with your house. What's the one thing you always wanted to change or add to your house to help you lead a better life using technology?

What's the next big idea.
