

- **If you're a beginner, you can:**

- Learn what the hardware guys do and maybe automate a task from your everyday life.
- Put sensors around you to alert you.

- **If you're a hardware hacker, you:**

- Can modify your project using ideas from Arduino™ projects.
- Will definitely appreciate the simplicity and ease of use provided by the platform.
- Can contribute to the project, help develop the platform and enhance your knowledge.

- **If you're a student, designer or entrepreneur, you can:**

- Develop prototypes faster with increased simplicity.
- Turn ideas into working hardware with support from a huge community to help you.

Seems too complicated? Nay!

You may have tried hardware programming previously, but become overwhelmed by the long process of complicated programming commands and the flashing of the EEPROM.

With the Arduino™ platform, the complicated programming syntax has been replaced with simple syntax that many times justifies itself. The process of flashing the microcontroller has been reduced to just the click of a button. No more removing of the controller to plug it into other hardware for the process of flashing the microcontroller.

What about the price?

Though the price of the board may seem high compared to the cost of a microcontroller, you won't have to spend on adding things such as a clock generator, making the PCB and soldering just to get the microcontroller working. Also, you save on the cost of flashing (programming) the controller, which is a hefty charge if done by a professional.

If you have prior experience with hardware and want to make the board on your own, you could just use the design files available online. For beginners, we suggest you buy a board.

Money matters
