

Since its inception, the Arduino™ has been widely used to create devices ranging from simple ones that help complete everyday tasks to complicated projects such as remote control the flight of various aircrafts in research. Students, hobbyists and professionals use it widely as it simplifies the entire process of hardware design.

Possible applications of Arduino™

The number of applications possible is limited only by the imagination of the creator. A quick search online will reveal the many applications developed by users around the world with the help of the Arduino™ platform. The various sensors in our smartphone such as the accelerometer and gyroscope that detect the smartphone being tilted can be interfaced with the Arduino™ platform. Here are a few of the possible applications of Arduino™:

1. Virtual reality gaming

Various sensors can be attached to different parts of the human body using clothing, as shown in the image. These sensors will detect your movements, which will be actions performed for the character in the game, and replicate them on the computer. This might seem similar to gaming systems such as Kinect. But the new gizmos won't have the limitations of these devices.

Gaming in virtual reality

2. Automatic room light

Using sensors, you can detect when people are moving in and out of a room. When no one is in the room, appliances (tube lights, fans, TV., etc.) can be automatically switched off saving precious electricity. What more, you can even set it to turn on the AC at a particular time or switch it off. Going a step ahead, it's also possible to connect sensors to the internet and automate your home from any part of the world that has an internet connection.

3. Motorised Snake

Everything in nature operates efficiently enough to serve as inspiration for
