

Artificial snake. This won't harm kids

many a manmade object. Those interested in studying animals and their biological systems can do so by mimicking them using technology for a better understanding of how these animals perform things with such efficiency. People have built a snake with motors using Arduino™ that can even travel on water!

4. Automatic garden watering system

Let's say you have a garden outside your home (A dream for most Mumbaikars) or a greenhouse and there's no one available to water your plants. In such a case, you'll probably want to check the moisture level in the soil and set up a system to water it accordingly. Using Arduino™, it's possible to either do this or schedule watering of the plants and then start the water sprinkling system automatically to maintain the required level of moisture.

5. Quick Laces

This is for the laziest or busiest people who don't wish to waste time tying laces. Someone has even automated tightening shoe laces.

6. Automatic turn indicator

Automatic laces

It's true that many bikes and cars available in the market turn off the indicator automatically, but it's also possible to build an indicator that switches on when you start turning the vehicle and turns off on detecting that the turn has been completed.

7. Direction indicator for bicycles

Road safety is of utmost importance, even for short distances especially if children are involved. Since most bicycles don't have a turn indicator,
