

BOARDS FOR EACH APPLICATION

Wearable Electronics

The dance in the movie 'Step Up' used LED lights to enhance the dance moves. These and many other places are where wearable electronics come into the picture.

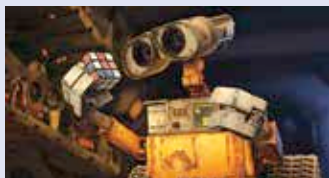

The Arduino™ boards of the LilyPad series namely LilyPad, LilyPad USB, LilyPad Simple and the LilyPad Snap are best suitable for this application since they look good in terms of both, design and colour and usually have the required processing power and capabilities to suit such kind of applications. You could also consider the Arduino™ Nano, if need be.

Augmented Reality Gaming

With an analog joystick with central push-button, four push buttons as in a gamepad, microphone, light sensor, temperature sensor, three-axis accelerometer, RGB led bright LED with Red, Green and Blue elements for colour mixing, TFT display connector for connecting a colour LCD screen, SD card, or other devices that use the SPI protocol, the Arduino™ Esplora is definitely for making your own gaming pad, that you can bash about.

Robotics

The Arduino™ Due and Arduino™ Mega 2560 are the most suitable boards for building small robots. If you need to connect more motors, only these boards allow more inputs that might be needed to connect all the motors and the sensors necessary for Robotics applications.

Internet / Network Connectivity

While there's a shield available with an Ethernet port, the Arduino™ Ethernet board is the best choice when it comes to network connectivity via the Ethernet.
