

ARDUINO™ DUE ONLY LIBRARIES	
Plays audio files from an SD card.	Audio
Manages multiple non-blocking tasks.	Scheduler
Communicates with USB peripherals such as mice and keyboards.	USBHost

ARDUINO™ YÚN BRIDGE LIBRARY	
Enables communication between the Linux processor and the Arduino™ on the Yún.	Bridge Library

preliminary reason for the wide acceptance of the Arduino™ platform.

Our literature libraries have books that simplify the process of understanding and supplement our knowledge. Similarly, Arduino™ libraries have functions

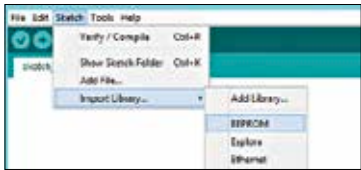

Breakup of Arduino™ code

that help the programmer simplify the task of programming to help develop a wide variety of applications.

Libraries reduce the task of programming the external hardware from complicated syntax to simple words that justify themselves. These libraries talk to GSM hardware, control motors, display content on LCD screens and sense distance using ultrasonic sensor. Many developers have developed their own libraries that can be used with Arduino™.

Libraries included in the Arduino™ IDE

These libraries are directly available and can be used by clicking on Sketch > Import Library > [Library you wish to select] on the menu bar.

Using built-in EEPROM library

As you can see in the screenshot, we selected the GSM library, which added the following line at the beginning of the code:

- `#include <EEPROM.h>`
