

capabilities to your Arduino™ device using LAN in addition to helping you connect to the internet easily.

We recommend getting an Arduino™ Ethernet board, if it's possible, instead of attaching an external shield.

It has an on-board micro-SD card slot, which can be used to store files for serving over the network.

Arduino™ Wi-Fi Shield

Arduino™ Wi-Fi Shield

Though ethernet is the most secure way to connect devices, its range is limited by cable length.

Wi-Fi has the added advantage of being usable on mobile devices within the range of the router. Also, multiple devices can be connected simultaneously.

The 'Wi-Fi Shield' can connect to Wi-Fi version b/ g and supports WEP and WPA2 personal encryption for added security.

It also has an SD card slot.

Arduino™ USB Host Shield

The 'USB Host Shield' acts like the USB port of your computer, allowing you to connect the various peripherals that are connectable on your computer. E.g. keyboard, mouse, Android devices, digital cameras, external hard drives.

The Arduino™ USB Host Shield can be used with the 'USB Host Library for Arduino™'.

Arduino™ USB Host Shield

Arduino™ GSM Shield

Though the internet is a great option due to its speed and versatility, there might be times when an internet connection is not available.

A cellular network is much more reliable than any other.

In such cases, an Arduino™ shield can be used to connect to a 2G cell phone network.
