

Arduino™ GSM Shield

SMSes can be sent as well as received to give and receive instructions to and from the device. It also has a provision to connect a speaker and microphone.

It can be used to connect to the internet via GPRS.

This shield uses a lot of power and might need up to 2A current when using data services.

Arduino™ Proto Shield

The ‘Proto (short for Prototyping) Shield’ simplifies the design of custom circuits.

It’s an ideal choice for quick testing of custom circuits or when there are no shields for your application.

We feel it’s much better to use this shield than connect a separate breadboard. Connecting a separate breadboard can leave many loose connections.

Arduino™ Proto Shield

Arduino™ Wireless Proto Shield

Arduino™ Wireless Proto Shield

The ‘Wireless Proto Shield’ allows an Arduino™ board to communicate wirelessly using wireless Xbee modules.

It has a communication range of 300 feet outdoors (without any obstacles in between) and up to 100 feet indoors.

The baud rate of the modules must be considered when using them.

Arduino™ Wireless SD Shield

Similar to Wireless Proto Shield, the ‘Wireless SD Shield’ uses Xbee modules for wireless communication with a range of 300 feet outdoors and 100 feet indoors.
