

Body:

Plant: The soil is getting dry. I need water.

Water tank: The water tank is half filled.

Temperature: Phew! It's 37°C.

Humidity: 61%

Thirsty plant asking for water

Might sound crazy to some of you, but this could be our world in the near future. While plants can't currently communicate with us, technological advances can enable them to do so with our assistance by monitoring and helping them survive the changing conditions. On a grander scale, we can expect better agricultural produce from our farms.

Let's come back to that presumably from the future email you just received. You look at the various kinds of information provided and decide to water the

plant. Based on the temperature, humidity and time of sent email (many hours before sunset), you may decide to water all the plants for 10 minutes. But wait a minute...the water tank is half filled. So you finally decide to water for six minutes or until the soil is moist and save some water for later use. To do this, you send a reply.

Subject: Re: Your plant here. I need water.

Body:

Plant: Water 6 minutes or till moist, whichever is less.

So you send a reply that looks like an email you'd send to your mobile company to activate the internet service, request to start (or stop – as more likely in India) a value added service or may be to vote for your favourite contestant in some reality show.
