 - Intel Galileo (Arduino™ compatible board)

Arduino™ Certified Program

This program is targeted at companies using processors not supported by the Arduino™. By being Arduino™ certified, these products are at the basic level of compatibility with the Arduino™ platform. The Intel Galileo is an Arduino™ Certified board.

Advantages of using certified hardware:

- ◆ Arduino™ developers provide advice and help on creating documentation in compliance with Open Source Hardware practices.
- ◆ Arduino™ developers provide support in creating a custom IDE.
- ◆ A dedicated space on the Arduino™ website in its online store.
- ◆ Developers can tap into the power of the Arduino™ community.
- ◆ The “Arduino™ Certified” logo can be used on the product.

To allow greater adoption of the Open Source Hardware movement, the hardware counterpart of the Open Source Software movement, Arduino™ has created the Arduino™ Certified Program.

Arduino™ Yún

The Arduino™ Yún board combines the power of Atmel AtMega series ATmega32u4 microcontroller and the Atheros AR9331 chip. The Atheros processor supports a Linux distribution based on OpenWrt named ‘OpenWrt-Yún’.
