

Computer Vision for object (car and tree) detection

Possible applications of the Intel Galileo are:

- ◆ Creating software for hardware such as Google Glass and smart watches
- ◆ Monitoring health of elderly
- ◆ Brain imaging
- ◆ Computer vision
- ◆ Virtual reality

Hardware specs

Processor:

- ◆ Intel® Quark SOC X1000 application processor
 - 16 Kbytes L1 cache
 - 512 Kbytes of on-die embedded SRAM
 - Single thread, single core, constant speed
 - 400 MHz clock speed
- ◆ 256 MB DRAM

To conclude...

In this chapter, we looked at some yet to be released hardware (Arduino™ Tre) as well as existing platforms such as Arduino™ Yún and Intel Galileo that add the extra punch of processing power for scientific applications and applications that run advanced algorithms like Image Processing. In spite of being advanced hardware, they still inherit the simplicity of the Arduino™ platform and allow communication between the computing chip running Linux and microcontroller running its own code. Hope you use them to make the impossible possible.
