

C#

C# was developed with the aim of creating a language that suited just about *every* development need

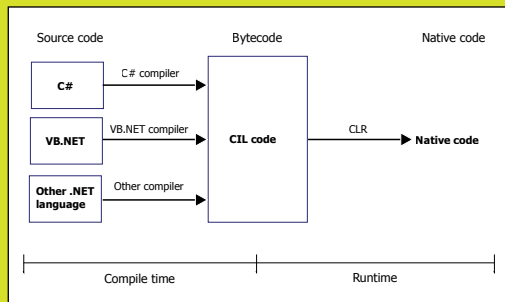

Introduction

When languages such as Java and C++ already existed, was C# really needed? Some say it was only developed by Microsoft to take on Sun's Java?

C# was developed by Andres Hejlsberg and his team at Microsoft. In one of his papers, Hejlsberg commented that most programming languages had flaws. This led him to develop CLR (Common Language Runtime) – which is an environment that promotes the conversion of compiled byte code directly to machine instructions for a CPU to execute (that's execute as in run, not execute as in hang unto death) – and later led to the to the creation of C#.

C# and Java

C# was released in the year 2000, and was quite similar to Java in functionality. Though Andres Hejlsberg always said C# shared more similarities with C++ than

CLR in use
