

was presented. A demonstration of Wine running on an emulated environment of Android was showcased which you can have a look from the following link <http://dgit.in/WineOnAnd>. You can also check out the slides of the presentation at <http://dgit.in/x86OnAnd>.

Conclusion

Picking the right virtualization or emulation tool is totally dependent on your requirements. If you want to play around only with the features of one particular operating system then virtualization is a better choice, but if your intention is to use the operating system to check out only a few applications, then using Wine or Cygwin would be preferable.
