

for Android app development. You can code an entire app as well as test it in Android Studio. The emulator is available for Windows, Mac and Linux, so no one is left out of the fun.

The Android Studio is not for the layperson, but if you want to emulate a proper device, complete with all the intricate little settings then Android Studio is your go-to emulator. You can choose from a vast range of pre-configured devices or create your own specifications for an Android emulation. When we say that you can emulate all the details, we mean that you can also simulate calls and SMSes to test the device. Android Studio is best left to the professionals. There are plenty of other emulators out there built for the sole purpose of enjoying the Android experience on desktops.

Genymotion

Genymotion falls into the category of emulators meant mainly for app development and testing. In fact, this emulator can be used by an entire team, from the software developers to the support personnel. While the developers can use it to build, test and view their apps, the support team can use it to simulate an app problem and the sales team can use it to demonstrate the app. Genymotion is one of the fastest and most versatile Android emulators around. It's available for Windows, Mac and Linux.

When we say it's meant for the developer, we mean that it has plenty of features meant for app development and testing, which wouldn't mean much to a casual Android gamer or someone who wants to use an Android app on a big screen. It has features such as resizable windows, screencasts, Java API,
