If you find OS X Mavericks or Yosemite frustrating to use, head on over to virtualdesktop.com once again and try different Mac OSes they have to offer. Your choices range from Mac OS 8.6 to OS X 10.2 (Tiger). They OSes come with working mail clients, viz. various versions of Outlook Express and Apple Mail and fully functional web browsers- Internet Explorer and Safari.

According to the website, these are complete desktops with system tools like System Restore and even have wizards like Network Setup Wizard and Internet Connection Wizard. Despite all these features available to you, these OSes (including the Windows) are far from complete OSes. You can't even use the calculator in and just about every other application seems to be around for the sake of being there. On the whole, the website is there for the fun of it and if you're expecting the kind of use you'd expect out of a virtual machine, you're out of luck. While these OSes do a great job at giving you an idea of how these interfaces evolved over the decades, maybe it would be nice if somebody decided to emulate some of the lesser known ones like BeOS or NeXTSTEP.

While these desktop emulators don't do a very good job at giving you the experience of using a proper OS with the convenience that a cloud OS would give you, the same can't necessarily said when it comes to mobile OSes with the iOS being the only exception.
