

Run and be free!

Things start sounding a lot better when you see that you don't actually need a proper computer with high specs and stuff to test your apps. All you need to do is sign in and launch the app's .apk file with the display of your choice. But, the aftertaste hits you when you realise that the entire system is super slow. Then again, it's free and the preloaded apps work like a charm. Except the camera.

Firefox OS Simulator

If Google have their own smartphone OS, so do Mozilla. Their Firefox OS is an opensource community supported mobile phone OS with ambitious goals of taking on the likes of Android and iOS. Just like how Adroid apps can be used on the Chrome browser, Mozilla have clubbed the previous two subheadings and come out with an extension for the Firefox web browse that allows you to test your apps from the comfort of your home.

Available at <http://dgit.in/foxsimm>, the extension needs to be installed on Firefox 30 or newer and supports Firefox OS 1.1. The simulator comes with a bunch of preloaded apps and give you a lot of control over various features like screen rotation. The extension is kinda heavy.
