

needs, or you can use one of the many frontends available for DOSBox that make all that simpler.

One such DOSBox launcher is DBGL (DOSBox Game Launcher). One of its many benefits is that it for many games — offered on their website — it can simply load an archive containing the game with associated metadata and have it ready to launch in minutes with almost no configuration required. Their website contains hundreds of such games that are pre-configured in zip archives.

The early years of computing are of course full of different computer architectures, and a plethora of configurations before desktop computing finally settled on Intel's x86 as the One True Architecture. Even Apple after staying with the PowerPC for quite long finally settled on x86. This is certainly not

because it is the best or most meritorious architecture, this is just one of those accidents of history.

Let's just say the history of personal computers is a lot more interesting than the present. Today you feel positively old if you remember a time where there were more than two options for x86 processors. And that's just speaking of x86. The competition between Intel and AMD seems like a fight between two vendors selling vanilla ice cream; the past had many more flavours.

- Let's recount a few of the PCs past:
- Commodore PET using the MOS 6502 processor
- Apple][using MOS 6502
- Atari 400 using MOS 6502
- Commodore 64 using MOS 6510
- TRS-80 using Zilog Z80
- Atari ST using Motorola 680x0
- Sinclair ZX80 using Z80
- ZX Spectrum using Z80
- TI-99 using TI TMS9900
- Sinclair QL using Motorola 68008
- BBC Micro using MOS 6512

The Elder Scrolls II: Daggerfall running in DOSEmu launched via DBGL. This game is now free and available on their website.
