

ExaGear lets you play Windows games on your Android device

possible, place the folder in the internal memory of your Android device instead of putting it on the external SD card. This is because Android 4.4 KitKat prevents the device from writing on select folders in an external SD card. Though, if your device's memory is full, you can place in the public 'Downloads' folder.

Once done, fire up the DosBox Turbo app on your device. Click on the keyboard icon on the top. Now for the most important part – you will need to tell the app where you have kept the file. To do that, type in `cd newgame`. Now type in the name of the executable file. In our case, the executable application is 'mygame', so we are going to type in `mygame` and that will run the executable file. If you have placed your game files in the download folder, you will first have to go to that folder. For that, you will have to type in `cd Downloads` and hit enter. After that you will type in `cd newgame` and from here on, the process is the same as before.

Here's a quick tip. While using DosBox Pro, or any other emulator, some of them may not have the gamepad keyboard for you. You can download a gamepad app from PlayStore. There are several good ones there. Once the download and installation is complete, you will want to open the app, and change the keyboard settings so that the device recognizes your new app.
