

finding their way to the App Store, we suggest you to keep an eye check on the subreddit r/iOSGaming.

If you own an iOS device, and can't resist to get an emulator, there is a way around. You will need to jailbreak your device (like the rooting process in Android). It should be pointed out that, when jailbreaking, besides the risk of bricking your device (making it unusable), you're also running the risk of losing warranty on your device. On the flip side, once you have jailbroken your device, you will be able to do a lot more on it, and that includes the ability to download apps from third-party stores.

For PlayStation, NES, SNES, GENESIS, and GBA RetroArch

RetroArch is also available on iOS through the 3rd-party app store called Cydia. Once you have installed Cydia (you will need to perform jailbreaking on your device to do that), go to the RetroArch Cydia page, and hit the 'Modify' button on the top right corner and hit 'Install'.

Once done, move the ROM files of all your favorite PlayStation and

N64 titles to the your iPad. You can use iExplorer for that, it is available for both PC and Mac. You can also download the freely available ones using Safari or any other browser. Once done, just hit 'Load Content' in the app and the emulator will detect all the supported ROMs you have stored on the device.

A great thing about the app is that it automatically detects the corresponding gaming console engines for the ROM file you have provided. The app gives you full ability to configure the screen size, sound, controls and other settings.
