

Windows Phone

Windows Phone doesn't have too many popular apps, but people will be happy to know that there are at least two good emulators available on the platform.

vNESLight

vNESLight is a free Nintendo Entertainment System (NES) emulator which comes with a range of features and customisation options. It is free to use, but you will see ads in a free account. There's also a pro version by the same name available on the Windows Phone Store which disables ads. The app offers integration with OneDrive and automatically saves game progress to it. It supports zip, rar and nes file formats. It also offers demo copies of Battle Kid 2 and Super Bat Puncher.

Snes8 for Windows Phone lets you run NES files

Snes8x

Snes8x is a Super Nintendo emulator for Windows Phone 8-powered handsets. Interestingly, the app is completely free and doesn't show ads. It allows any number of ROMs you can store on your phone. The app also autosaves the game progress, and features a 'Turbo' mode, which can be used to fast forward the gameplay. Like vNESLight, the app comes with an integration with OneDrive, allowing users to import and export save files.
