

Emulating Safari for mobile from a desktop to test website's appearance.

of devices. Thus, web designers prefer browser emulation for cross-browser and cross-device testing of their design.

Google Chrome and Apple Safari use WebKit, a layout engine software for rendering web pages. Mozilla Firefox uses

Gecko engine, whereas Internet Explorer uses Trident engine.

A browser emulator strips a browser down to only its layout engine software component and replaces it with existing layout engine software component. With this approach, although the browser is the same, the rendering engine used by it belongs to a different browser. This technically makes it a different browser without its toolbars and other functionalities.

There are many browser emulators available. While some are freeware, most are not. A few web-based emulators let you test your web page directly online. Some emulators are merely add-ons to software development kits such as Visual Studio. Few device makers also provide emulators for their mobile devices.

Browser emulators

We've curated a list of browser emulators – both, paid and free – that will help you easily test everything website related with more than 300 different browsers combinations.

Ghostlab

Ghostlab is one of the best browser emulators available. It synchronises scrolls, clicks, reloads and input across all connected clients. With these features, it not only offers web page testing, but also provides a complete user experience. An in-built inspector discovers problems associated with the web page, brings them to your notice and helps you quickly resolve them.

Ghostlab offers emulation for Firefox, Chrome, Safari,
