

relating to their child, it is also important to set-up digital safe-guards which will protect your children when you can't. Setting up parental controls on the individual devices is a good first step towards managing your child's exposure to the web. There are a myriad of means of solidifying these measures such as installing child-centric customised user interfaces on the specific devices your children will be using. We shall be discussing how parents can do that in the next section.

Installing Custom User Interface

During the course of their early life children will encounter all forms of technologies. Just in the house it is very likely that PCs, tablets and

Everyone has a right to technology

mobiles will be available for them to explore. So we present you with options of customised user interfaces which will not only make it very easy for you to manage your child's content intake but also ensure their maximum engagement.

For PC

When it comes to computers there is a whole world of options to choose from but the selection of interfaces isn't

quite as varied. While many corporations have made attempts at designing child centric PCs, none of them have are truly value for money in comparison with the free-to-use options from the open source community. The convenience of recycling an old computer desktop or laptop for your child's needs has never been easier thanks to Linux based operating systems. The open source community driven user interface has a good selection of options to choose from for every age group. Not only does this save parents money, it also allows you to customise your interface as your child grows. We take an overview and walkthrough of the most useful Linux based systems for children.

DoudouLinux

Even as the name cause mild sniggering in adults it is just a tongue in cheek
