

would like to deploy it. If you wish to install it on to a system then you will need to burn it to a CD. Then you will need to insert the CD into the machine on which you wish to install the OS and then start the machine. You will be prompted upon starting the machine if you wish to proceed to the existing operating system or go to boot drive to install Qimo - from here you can also choose to run it off the CD directly. On selecting the install option, the process is a very simple step-by-step procedure. Remember, that on installing the OS you will wipe out the existing OS.

For iOS

A sizeable number of people are beginning to use tablets in the home to entertain and educate their kids. However, tablets only come in two operating systems i.e. the Apple iOS for iPads and Android OS. The iOS system is a fairly uniform and rigid system in visual appearance which makes it appealing to both kids and adults. The user experience however is extremely convergent which allows for any user, even a child, to easily jump between existing apps to buying new ones, or to move from a browser to a video streaming app with ease. Although these features make the device easy to use, they aren't necessarily desired for kids.

In order to make an iOS device child-ready the adult needs to tinker around in its settings. The first thing to do is to activate the Restrictions option from the Settings menu under General Settings. Using the options here adults can restrict which applications are permitted on the device. You can activate Restrictions and set up a four digit passcode which needs to be something your child wouldn't be able to guess. Other changes advisable is to decide if you want your child to have completely unrestricted access to the internet or not. For the former, it is best to detach the device from

It's all in the settings

the internet by not installing a SIM card or setting up a Wi-Fi connection. This will ensure that the child only access' the apps and data that has been set up on the device by the adult.

Alternatively, internet based applications like Safari and YouTube can be deactivated from the Settings menu.
