

While playing Minecraft, players must figure out how to best use their resources. For example, for paper you require three units of sugarcane. In this way, the game also improves basic math and manipulation skills. Minecraft only uses cubes to build structures. But these structures take on different geometrical shapes like cuboids, tesseract, square-based pyramids, etc. In this way, kids get a quick lesson in 3D geometry. Setting up circuits teaches kids the basics of logic circuits. Feedback is immediate and safe. You can build switches without electrocuting yourself. You can even construct weapons to guard against attacks.

Setting up a server allows parents to give their children a safe environment to develop social skills and teamwork.

NASA's Space Place

Platform: PC (web), Android and iOS

'NASA's Space Place' is a website developed by NASA in 1998 and is complete with interactive games, projects and facts about Earth and Space. The collection of games offered is complex and interesting, each teaching you something new. Each game offers a new topic to be learnt, for example, how a black hole works.

The activities have detailed information on the solar system and other

science topics. Kids can freely ask questions and get audio responses in return. There are instructions for at-home experiments.

'Space Place Prime' is a spin off from NASA's Space Place. A majority of its content is educational – be it articles, imagery or movies.

The Space Place program has also released several

mobile games mostly for iOS. These include 'Comet Quest' and 'Satellite Insight'. Comet Quest is a game revolving around the Rosetta Mission. You're given a spacecraft and learn how scientists use Rosetta to explore comets. Satellite Insight has a more complex background story. You have to save the 'GOES-R' satellite from losing any of the data it is collecting by safeguarding the data grid.
