

chapter guides you through the different categories of tech-related gadgets and online software to help you ignite the genius within kids.

ROBOTICS

Everyone, at some point in their lives, has considered the possibility of owning a robot that does what they ask of it. That goal seems easier to achieve in today's world. We'll talk about some of the popular robotics-based toys in the next few pages.

1. Ozobot

Ozobot has been termed as “an intelligent robot that can be used for both, physical and digital gaming.” Ozobot is a small, spherical-shaped robot that has color detection and line-following capabilities. With the latest technology in mind, the creators of Ozobot went a step further and made the robot compatible with iOS and Android platforms, enabling the robot to

be controlled via a smartphone or tablet. The robot incorporates a five-sensor array for line detection and comes with a Li-poly rechargeable battery. It also has gyro-sensors and sensors to detect physical and digital surfaces, color and time of day for better performance. Despite its many features, the Ozobot is touted as the world's smallest

robot, measuring only over one inch in both, height and diameter. The company further claims that Ozobot has the ability to make independent decisions, thanks to the random algorithms added to it. The micro-USB charged robot can be used in a wide range of gaming activities, from simple line following to digital racing games such as the 'Ozobot OzoRace', the company's proprietary game for iPads. The race is designed to start on the iPad and then continue on a physical track (which has been coded by the user). This application is a hybrid inclusion of both, physical and digital surfaces. Another fun feature of the Ozobot is the multicolor LEDs that provide visual feedback. They can also be coded by the user to show a specific display.
