

Introduce kids to Scratch and watch them become programming geniuses

2. MIT App Inventor

If you've ever wondered how one could make Android applications without extensive coding knowledge, then the 'MIT App Inventor' is for you. Developed in partnership with Google Inc, the App Inventor is an extensive software that runs as a web service, letting anyone with access to the internet and a Google account learn how Android apps are developed. App Inventor works along the same lines as Scratch. It features digital 'puzzle pieces' that users can logically connect to perform tasks. However, the usage of App Inventor is much more extensive since it can even be used to create full-fledged Android apps. The variety of tiles include media tiles, internet tiles, camera tiles and so on. Users can create mobile apps, widgets and web apps as well.

App Inventor is divided into four main sections: The designer, blocks editor, compiler and a debugging app. The design window is where the components of the app such as windows, buttons and pictures are arranged together. The blocks editor does the behind-the-scenes work. Here's where you arrange each block in accordance with the corresponding block. The compiler and debugging software are apps provided as a download to run on a computer to ensure the user's app runs smoothly.

App Inventor has more than 85,000 weekly active users and an app database of nearly 47 million apps. It has been used in a wide range of fields
