

MIT does it again with the App Inventor

such as education, government and research. Hence, App Inventor provides an easy way to begin app development without any real knowledge of Java or the Android programming framework.

Visit the App Inventor homepage at <http://appinventor.mit.edu/>.

3.Kodu

The 'Kodu' Game Lab is a visual programming language developed by Microsoft Inc. Originally meant for the Xbox, it's now available as a download for computers running Windows as well. Kodu is a supplement to students who are interested in learning coding, but didn't find it appealing enough. It provides a fun visual approach to programming.

Kodu teaches object interaction, mathematics, logic and so on. It's designed as a game maker with a cute little animated player ready for use. The user can move the player around the screen, give it commands to carry out and add objects as well. Users can click on the objects and give them a behavior, so that the player can interact with the objects later in the game. There's also a lot of visual customisation such as landscaping, changing the surface of the game, etc. Then, using if-else conditions, the user provides instructions to the player to be executed in the game. The game can be compiled and exported as an .exe file as well. Kodu is being used as an educational resource in many schools. As reported
