

Vroom with Anki Drive

Chassis, Engine and Energy. The most significant part about the cars is that the cars come with a form of Artificial Intelligence that lets them determine where to go, whether the region ahead is safe to travel on or not, and so on. A user can play against another player or play against the secondary car as an AI. There are four game modes: 'Race Mode', 'Team Mode', 'Battle Mode' and 'Balance Mode.' Each of these modes relies on the attributes mentioned above for the cars to compete with each other.

2.Nano-Falcon

The 'Nano-Falcon' is touted as the world's smallest helicopter. It certainly is small considering its weight of 11 grams and length of 6.5 cms! It comes with a gyro-stabiliser and a built-in rechargeable Li-Poly battery with over five minutes of flying time. Included is the Infrared remote controller, which uses four AA batteries and transmits up to five meters. Despite being so small, it has all the functions of an RC helicopter, such as hovering and moving around on all axes, among other things. This tiny and cute helicopter is definitely worth a look if you're interested in tinkering with RC vehicles, but don't know where to start.
