

Small is good

3.Parrot Drone

Not more than a few years ago, drones were considered as military-grade hardware. Today, drones are used in civil research and autonomous operations, as tools to carry resources from one location to another, and even sold as novelty toys to children in retail stores. One such product is called the 'Parrot Drone', a hybrid of a toy and a highly useful piece of equipment.

The Parrot Drone features a three-axis gyro-stabiliser to correct itself should anything happen to the flight ultrasound sensors to detect ground altitude measurement. It also has a 720p HD camera to record videos and take JPEG pictures of the flights undertaken.

The structure of the Parrot is made entirely out of carbon fibre, while the inner mechanisms of the drone are protected by foam padding. It uses four brushless motors for propellers and a motor controller that manages the functioning of each motor. The Parrot's most advanced features are its GPS navigation system and Flight Enhancer. The GPS system weighs 31 gms and the bundled 4GB flash drive stores any flight paths. The 'Flight Enhancer' is an app, which can be downloaded from major mobile platforms. It lets users view the flight path in 3D and control the drone via the smartphone, among other things.

The Parrot comes in four colors, and spare parts are included in the box, although the warranty covers any damages done to the drone.
