

A BRAVE NEW WORLD

Technology is the pathway to the future.
And that's only possible if children are
able to constructively use its full potential
to maximise their own

Technology is a great amplifier; capable of transforming the human mind and society at large with rapid ease. As tech becomes more pervasive in our world, it becomes increasingly important for us to assess its relationship and impact on the most vulnerable among us – the children. Technology for kids was once restricted to mere video games and elementary educational devices, but today it has become as intimate as their home-packed school lunches.

Today's kids are often times leashed to cellular devices and distracted with entertainment devices for reasons of safety and convenience. In doing so, their parents and caregivers risk the peril of these children encountering unfiltered content. As the disparate archipelago of technology unifies with the mainland of a kid's daily misadventures, we need better means of monitoring and directing it towards a safer state. While tackling the difficult questions in our roles as parents, siblings, educators and citizens, we must also lay down the law on a force as powerful as the internet and social media which can influence our future generations.
