

Everyone wants a parrot drone. Including you.

3.RoboMe

‘RoboMe’ is a fully built robot that has the power of customisation. Users can give the robot its own personality by attaching an iPhone or iPod to the robot’s head, wherein the robot’s ‘face’ appears. Users can then play around with each feature of the robot’s body, such as face and arms. You can ‘program’ the robot using the mobile app to perform custom moves, like running around, dancing, etc. The robot comes with an array of sensors which allow it to interact with outside objects. Even humans. (The robot can shake hands with you!)

The AI of the robot is so designed as to let you investigate outside objects around itself. Perhaps the best part of RoboMe is its voice recognition system. One can upload a set of commands via the app and then speak out those commands to RoboMe.

4.Arduino

‘Arduino’ might be a little advanced for children to use, but that doesn’t mean its not worth a mention. The website describes it as “an open-source electronics platform based on easy-to-use hardware and software”. More simply, Arduino is an open source electronics prototyping board originally meant to reduce the time taken to develop new products, but now being used as an educational and recreational tool all over the world.

Arduino has applications everywhere – botany, robotics, even space. A project involving Arduino called ‘ArduSat’, which lets people develop their own space-based experiments, is a by-product of the technology. Children
