

database of websites spanning 44 additional categories (similar to the ones they use for their enterprise level software), including games, humour, entertainment, music, etc. You can also choose to block URLs that contain specific keywords. Similar to a feature in Net Nanny 7, it can analyse web pages to detect profane/inappropriate words and censor them.

Besides the standard web protection and blocking, it also has a basic form of scheduling, so you can restrict your child's internet usage during bedtime, thus ensuring they do not waste time on late night browsing sessions. K9 also comes with a unique "Time-out" feature, wherein you can block complete web access if your child constantly attempts to access restricted URLs/domains. The trigger settings can be varied between 5-50 attempts every 5-60 minutes, while the Timeout period can vary between as short as 5 minutes to even a whole day!

K9's report summary feature is quite extensive for free software. It gives you a breakdown of Internet usage as per category including number of blocked requests along with a detailed breakdown of how the requests were blocked. You can review each blocked URL along with the reason for blocking, although it is not currently possible to identify the user account that requested the URL; this can prove a major drawback for PCs that are used by multiple children.
