

This Fast Track tackles these issues and advises you on how to best use tech to your kid's advantage. We'll cover various topics – beginning with the basic discussion of what “kids technology” is and going all the

way up to laying out This may soon happen a digital curriculum

using which kids can make the most of the tools available to them. Managing an equilibrium of knowledge and security is the biggest challenge before us. And while we may not be able to constantly protect kids from the chaos of the interconnected information network, we can ensure that nothing of significant harm leaks into their as yet unspoiled and tender minds with the help of useful utilities.

Kids Tech Vs. Adult Tech

It's hard to draw the line between tech meant for adults and tech for non-adults. The simple objects of demarcation are clearly the baby toys with blinking lights and the educational plastic playthings every frantic parent purchases when their child is born. But for the most part, the world of technology doesn't discriminate between its users. A child is just as capable of using a cell phone as an adult (after the baby drooling phase, of course). However, the manner in which children use technology is the distinguishing factor – such as their choice of websites and applications, not to mention their naive acceptance to what they find online.

The tools of technology. i.e. computers, consoles, mobile devices and tablets are designed to be intuitive and ergonomic with human behaviour. It's the unique approach that children bring to the already easy-to-use devices that makes them more “kid tech” than “adult tech” from the get go. While an adult would use these tools to accomplish a task, a child is more inclined to explore it organically. With this awareness in mind, technology makers have already started designing hardware and software products that are specifically targeted towards children which limit their exposure and
