

Restrict access to inappropriate websites

to malicious and inappropriate websites. This is done by replacing the default browser with a customized browsing tool that filters all incoming communication and restricts blacklisted URLs and domains.

In iOS devices, you will have to manually disable Safari browser using your Apple passcode. This ensures your kid is forced to use the Net Nanny browser for any online work. In Android, this is done by installing the Net Nanny app and logging in using your Net Nanny credentials, which requires a separate Android license (included if you have purchased Net Nanny 7 for PC/Mac). The Android app automatically disables/restricts the use of any other browser.

Both platforms require you to login using your Net Nanny credentials. Furthermore, if you use Net Nanny 7 for PC/Mac, you can sync the same settings with your smartphone/tablet app, thus saving you the hassle of having to reconfigure a new user account on each child's device.

Both platforms support safe search enforcement, profanity masking, as well as custom filter categories. However, this is where the Android version edges out over the iOS one by providing additional features such as an application manager, remote administration, and email notifications. Unsurprisingly, the Android version is more than double the cost of the iOS app. However, the Android app does have a minor drawback: overriding the restriction for viewing blocked websites is extremely tedious. For instance, if you wish to whitelist a particular website, you will have to login to the Net Nanny web portal and manually add the URL to the whitelist; there is no password override option in the browser.
