Net Nanny iOS: <http://dgit.in/NetNannyiOS>

eKAVACH (Android, iOS)

India's answer to digital parental control apps, eKAVACH provides Android and iOS users with a complete, failsafe option for securing your kid's internet use. Available for Android and iOS, eKAVACH has an extensive list of features from intelligent web filtering that blocks websites from specific danger categories such as pornography, violence, etc. to real-time alerts that provide parents with instant notifications whenever their child attempts to access a blocked website.

As is in the case of the Net Nanny, the Android version of the eKAVACH app is more feature-packed when compared with the iOS one. This is mainly due to Apple's strict security features that prevent third-party applications from accessing administrator-level controls. In fact, eKAVACH is heavily inspired by Net Nanny and includes more or less the same features such as safe search enforcement as well as real time notification alerts for restricted actions such as web requests for blocked websites, attempts to search for blocked keywords, and even attempts to uninstall the eKAVACH app.

The eKAVACH service requires you install two different applications on separate devices: the child version of the app is installed on the phone/tablet to be monitored, whereas the parent version of the app is installed on the device used for configuring devices and viewing reports. Using the parent app, you will be able to view a detailed summary of your child's online activity, including a list of attempts to view blocked URLs as well as a list of them same.

Another excellent feature of eKAVACH is the ability to geolocate your child via their smart device. This "heartbeat monitoring" feature keeps a track your child's smartphone using GPS and cell tower approximation, and keeps a detailed log of your child's recent locations. This enables you to gain a sufficiently accurate

Monitor your child's Internet use on the go
