

eKAVACH, in that it provides a secure browser for your children to use. You log in to the browser using the same credentials as that of the PC app and apply restriction settings as per your required level of protection. Note that you will have to manually disable the Safari browser and remove any other third-party browser as Qustodio can only monitor traffic through its own app.

The Android version does not have such restrictions and thus comes with a number of additional features. You choose which apps your kid can access by blocking them outright or simply monitoring their use instead. Qustodio provides additional support for monitoring calls and SMSs, allowing you to create a list containing safe phone numbers for incoming and outgoing calls and SMSs. It can also monitor social network activity in apps such as Facebook and Snapchat, allowing you to protect your child from potential cases of cyberbullying and online predators.

Qustodio's main selling point would be that it is available for free on both platforms, although you have to sign up for a Qustodio account. This allows you to store settings and reports on the cloud, saving you the hassle of configuring the app if ever you need to reinstall it, and allowing you to view detailed reports of your child's internet usage from anywhere.

DinnerTime (Android, iOS)

As the name suggests, the app was born out of a need for a way to get children to stay away from their phones during dinner and get them to spend quality family time. This simple approach was taken a step further, and the app now comes with a host of other features, all aimed towards getting children to spend less time on their smartphones/tablets and more time doing other quality activities.

DinnerTime simple concept is masterfully executed with an attractive and easy-to-use user interface. Whenever, you wish to call your kids for dinner or tell

Ensure your kids are smartphone-free during dinner time
