

them it's time for bed, you simply have to send a command from your smart device. This will bring up a full screen message on the kids' devices, pausing the running app and restricting any input until either the preset timer runs out or the parent enters a passcode on the child's device. The Android version of DinnerTime uses the same app for both the parent and child devices, while the iOS version requires separate apps for each device type.

After installing the DinnerTime app on your device as well as that of your child, you will have to go through a quick setup process. The child app will send an SMS to the parent device to initiate pairing, following which the parent device will have to send a confirmation message, completing the setup. Parent devices can then set break times for dinner and bedtime, during which the child's device will be unusable. They also have an option to pause the child's device using a button if you want them to take a time out from using their smartphone for unhealthy, prolonged periods.

Parents who are impressed by the app's functionality but are also looking for a more hands-on approach can try out DinnerTime Plus—an extension of the DinnerTime app with number of additional features. DinnerTime plus allows you to restrict device apps, as well as permit the use of apps on a time limit policy, preventing your kids from spending all their phone time playing games and chatting. It includes a live monitor feature that tells you which application is running currently running on your child's device as well as an activity history function that keep a log of the applications your child has been using. The free version allows you to link another device as a parent device, and with a small in-app purchase, you can unlock detailed usage reporting as well as the ability to link up to 5 kids' devices.
