

In the new text editor that appears in the terminal, type the following code:

```
• import RPi.GPIO as GPIO
• import time

• GPIO.setmode(GPIO.BCM)
• GPIO.setup(18, GPIO.OUT)

• GPIO.output(18, true)
• time.sleep(120)
• GPIO.output(18, false)
```

Let's analyse the code.

Code	Explanation
import RPi.GPIO as GPIO	Imports the GPIO library.
import time	Imports the time library that contains the 'sleep' function.
GPIO.setmode(GPIO.BCM) GPIO.setup(17, GPIO.OUT)	Uses pin 17 as an output pin.
GPIO.output(17, true)	Turns ON the lamp.
time.sleep(120)	Waits for 120 seconds or 2 minutes.
GPIO.output(17, false)	Turns OFF the lamp.

Now that you're able to control a lamp, let's try to control it from a web interface, so that you can control the light from some remote location using the 'GET' interface. The circuit for this piece of code remains the same; all you need to do is add the server parameters.

We'll use the Twisted web server to run this piece of code. Let's start by installing the web server. Open the terminal and type the following command:

```
• sudo apt-get install python-twisted

• from twisted.web.server import Site
• from twisted.web.resource import Resource
```
