

tech segment and it will definitely play a role in our daily lives. Particularly look out for sensors embedded inside garments, which we can expect in the next 2-5 years, with a few focused on enhancing people's health as well as fashion sense. It won't be long before we see such tech embedded into our bodies. By 2018, bio-integrated computing will have moved from the fringes, where it is today, and be thrust into the limelight having been taken there by its early adopters. Wearables will change the way we work, play and, of course, dress.
