

\$2,50,000 Navia is one of the first self-driving commercially available cars that is designed to work in pre-set closed environments like around a resort or an airport as a shuttle for example. In fact, you can actually take a ride in it at London's Heathrow airport.

The Navia self-driving car

As most of you would already know, Google - the technology giant has been working on self-driving cars for quite a while now right after they realised the potential of driverless cars when they launched Google Street View, they jumped into the idea with a modified Toyota Prius that they christened "Pribot" and provided the car a goal of fetching a pizza on its own. After multiple successful developments, Google's system was able to guide a whole fleet of modified Lexus and Prius cars more than half a million miles that too without causing any sort of accidents.

Google revealed its fully functional self-driving car prototype recently and it didn't look like any other car currently seen on the road. It has a cutesy look to it with a miniature body and round design. This two-seater car is electric powered and its speed is currently capped at 40 km/h although, Google has promised that it should be able to drive effortlessly at 160 km/h when it's fully developed that too without any sort of human interference.
