

The roads of the future will be nothing but connected Internet of Things highways as everything, right from the asphalt beneath your cars tyres to the car itself will all be interconnected wirelessly in one way out another. Information will flow between every vehicle on the road and the traffic signals to the transport department itself. Heck, with the deployment of these IoT devices and technologies for the road, human involvement will be the last and safety will take a proper front foot. After all, technology is here to make our lives simple yet unobtrusive in every way possible and the Internet of Things for the road holds a key to unlocking that potential.
