

interface and broad accepting file format compatibility. It has also made deep inroads in the professional industry with organisations like the BBC adopting it full time and Oscar award winning movies such as *Gone Girl* reportedly using it for . And with newer and larger video resolutions such as 4K and 6K becoming increasingly common, Adobe has proven itself to be the fastest editing platform. The speed and massive scale of resolution compatibility, along with integration with other movie making software such as Adobe After Effects makes Premiere Pro the fastest growing and most appealing video editing software for the new market of prosumer and professional users.

Final Cut Pro

Apple's Final Cut Pro has for the longest time been the second ranking industry preferred software after Avid. The software's massive appeal works in concert with Apple's Mac editing platforms which began pairing powerful hardware with the powerful software suite. The Apple appeal found footing amongst creative artists in movie making and Final Cut boasts of being integral in the making of Hollywood blockbusters since the early 2000s. Of course, the FCP platform only works on Apple hardware and easily alienates a significant portion of the consumer and prosumer markets who work on Windows. The latest iteration of the software, Final Cut Pro X, initially gained notoriety for lacking essential features and introducing radical shifts in layout and user interface. However, since then Apple has released over 10 updates which have satisfied and pleased professional editors everywhere.

Sony Vegas Pro

Generically, over 95 percent of video editors use one of the three (Adobe, Apple, and Avid) software but there are other professional video editing software which garner mention. While Sony Vegas hasn't been a big or mentionable part of Hollywood or mainstream movie making it doesn't make it any less powerful in its features and functionality. The program is regularly used for news and documentary editing across the globe and brings a professional level of performance in every respect. A unique aspect of Sony Vegas' latest version is called proxy-first workflow, which allows crews to remotely send proxy footage back to their home editing suites via camera adaptors. This allows home based editors to immediately begin editing as soon as the footage is shot and while more footage continues to be shot. All this takes place over the internet which means that shooting could be taking place in one part of the world while the editor is securely in her office working on the edit with zero delays.
