

The screen layout of FCP X reinvents the digital editing workflow infuriating many veteran professionals.

Magix Video Pro

We mention Magix Video Pro simply because editing is a creative field and not every user can have a natural aptitude towards advanced technical usage. For the myriad of users who find the digital interface a bit daunting Magix Video Pro brings professional power to a basic user interface. Of course, this makes Magix Video Pro rank far lower down the list but its ease of use for amateur video editors makes it essential for many. The usage of Magix Video Pro is well below advanced user status but is sufficient for doing a large part of video editing functions. This simply means that if you have ever used any video editing platform ever, Magix Video Pro will seem like child's play and if you're a frequent user of video editing platforms then it will be downright annoying. But if you're a first time video editor apprehensive of using complex interfaces then you will feel right at home with Magix Video Pro. An unexpected but entirely welcome feature of the current version is its ability to work with 4K footage and upload directly to YouTube which makes working on this software future-proof for any casual editor.

Open Source Software

As we know, open source software's are mostly built with a non-profit intent which results in them being customisable and free but also very slow to improve. Since they are supported by volunteer developers they can't evolve
