OpenShot

OpenShot Video Editor is a Linux only video editing platform that was launched in 2008 by an intrepid member of the open source community. The program is built using Python, MLT Framework and GTK with the goal of being a viable alternative for Linux users. Despite its humble beginnings the program supports numerous video and audio formats along with having GNOME integration. This free software also has many of the advanced editing tools such as chroma key, key frame animation, audio mixing, editing presets, image overlays and so much more. The platform's user interface is similar to the industry preferred standard and will be familiar to anyone who has used iMovie or

Windows Movie Maker. The software is in no way suitable for professional grade video editing but is at par with Sony Vegas in terms of performance, and is an ideal choice if you are a die-hard Linux user.

Cinelerra

With the open source program Cinelerra, you get two programs for the price of one - the price of one being zero. Cinelerra is a video editor and video compositor (more on those in chapter 7) for the Linux platform. Apart from providing standard use video editing tools, Cinelerra allows users to create visual and special effects using its powerful compositing features. This enhances the use of mattes and keying techniques within the video editing environment making overall video production more seamless. A unique aspect of its design is that it can support video of any frame rate and resolution. The Cinelerra editing tool is also highly versatile in terms of its audio rendering and editing abilities due to its 64 bit audio sampling along with its dual RGBA/YUVA colour space compatibility. So if you are a Linux based user who is looking for an all in one editing software that can handle most everyday editing requirements then Cinelerra is for you. Also keep a look out on its upcoming variation Lumiera which promises to be more advanced.
