

sitting at home. And a major reason behind this are the number of professional grade post production video editing and VFX software available in the market. So if you are planning to create a movie without a million dollar budget to spend on post production video editing and want to add Hollywood-scale visual effects into your fan movie, or just, want to add that professional touch to the short film you made with your friends, you have a number of software at your disposal. Some paid, some free, some open source. Here we list out all these alternatives and compare the best options from each category.

What is the usage scenario?

Post production video editing has come a long way since the times of the original King Kong. The 1933 movie where a giant ape climbs the Empire States holding a girl in his hand, confused about what he wants to do exactly, was shot one frame at a time (yes! one frame at a time) using an 18 inch tall ape-model that was covered with rabbit hair. The 1976 remake of the movie was shot using a 40 ft tall mechanical Kong that weighed more than 6 tons and cost \$1.7 million dollars. It is also the largest mechanical creature ever built. The movie was again remade in the year 2005 because let's be honest who doesn't love a giant ape climbing a tall building, girl in tow, err, hand. This time the Kong was mostly inside a computer. Created by Weta Digital effects studio using one of the most powerful supercomputers at the time, the giant ape was the result of Motion capture and digital animation. Creating King Kong took much more time than shooting the live action movie and was inserted into the footage during the post production process.

King Kong on top of the world
