

from the bottom to top while the node-based compositor renders all the scenes including the 3D environments in parallel. Both the systems have their pros and cons but generally a node based system is preferred when working on a complex project because handling too many layers can become very tedious.

Apple motion 5

Not everyone has the time and skills required to make a professional grade video. Sometimes a video software that lets you handle transitions, masking and compositing, creating and editing titles, and making and arranging simple 2D and 3D scenes is more than enough and

The software by Apple will take care of most of your basic post production needs.

software like After Effects and Nuke seem like an overkill. Apple motion 5 is aimed to fill this gap in the market. The software, though not as feature rich as the other software listed here, lets you do a number of things better and faster than its counterparts listed here and is also comparatively easy to learn. Another factor that works in its favour is its low price. Though the software still lacks a number of features that are a part of other software in the category, it does what it promises and does it well.

Foundry nuke 8

Another node based compositing and post production editing suite, Nuke by Foundry is the most popular tool used by a number of top studios in the Hollywood to create all those action sequences you rave about after seeing the latest Hollywood flick. Avatar, Hobbit, Rise of the planet of apes and Iron Man 3 are just a small part of the list of movies that used Nuke to attain the extravaganza you see on the screen. The software is available for Windows, OS X and Linux, and comes with probably the largest feature set you will see on any of the software on this list, probably many features that you will never use. The software is aimed at professionals and might be more than what most of the consumers might need. Saying that nuke will “burn a big hole in your pocket” is an understatement. Chances are you won’t have any pants,
