

under the GNU General Public License. The software comes packed with a number of features including options for 3D unwrapping, shading, Physics and particles, collision simulation, Edge rendering and much more. Unlike most of the open source software, Blender comes

Blender: The most popular open source alternative out there.

with a very streamlined user interface and has that professional touch that you expect of paid software. A feature that puts it apart from all the others on the list is the integrated game engine that Blender comes with. Though Blender is not the best Post production software, in the market and neither is the first choice for a game engine, It has amazing features when it comes to 3D animation and this list of 8 amazing short films compiled by www.techdriven.com are enough proof: digit.in/blendersf

Jahshaka 2.0

Another popular open source software developed under the GNU General Public License, Jahshaka is available on Windows, Linux and OSx. The software comes with all the standard features that you might require in your post production editing including, 2D and 3D animation and compositing, color correction, media and asset management, editing and effects. The software has a steep learning curve but the official website hosts a number of tutorials to get you started. Like most of the other open source software, Jahshaka is still a little rough around edges but if you don't want to sell your soul to the devil to get enough money to buy one of the proprietary software, then it is worth giving a shot.

Worthy mentions

DebugMode Wax

Wax by DebugMode is a free video compositing and special effects software available only on Windows. Wax has a number of features including a top-down layered 3D compositing mode with 3D objects, lightings, shadows, tex-
