

ture generators etc. and a number of 2D and 3D plugins. Another nice feature that comes with Wax lets you load and use VirtualDub filters, DirectX plugins and Freeframe plugins. Also Wax supports Windows movie maker pre-

The last update to Wax came out in the year 2008

sets which can be used with it. There also exists a TransitionPlugin SDK available for developers to create external plugins. For people who just want to use it for slicing and stitching videos, the software comes with more than 500 different presets to make the work easy for you.

Cinelerra

You would have come across this software in chapter 5(Video editing) also. Cinelerra is another open source software released under the GNU General Public License that is primarily used for video editing but it also comes with compositing capabilities. Available only for Linux, Cinelerra features a Non-linear editing system, like that available in most of the paid video editors including Adobe Premiere Pro, Final Cut Pro and Avid Media Composer. The compositor provides you with most of the standard features but still lacks very far behind After Effects and other such software. It is worth looking into for people looking for a free Non-Linear editor with basic compositing capabilities.

Our pick

Blender

No doubt that open source software have come a long way, especially in the last decade. Linux is now not only limited to geeks and has slowly been breaking into the mainstream. Instead of downloading the cracked version of a paid software, people are looking for Open Source alternatives. But still Open source software are behind their paid counterparts, though mind you not much behind.
