

will by default be added to the plane. Rotate the text 90 degrees along the z and x axis so that it's standing vertically and add depth by changing the extrude value. Select the Text,

Building everything from scratch

Press Alt+C and click on “Mesh from curve/Meta/surf/text” which will give you a mesh version of the text. The mesh isn't very clean and to make it easier to work with one can remove the double vertices and add “normal consistency”. Select the physics button from the right pane and select the “smoke” option. Switch to “domain” tab and select “smoke adaptive domain” and set the resolution division to around 150. And you are done.

To do something similar in After Effects, first google “after effects smoke text” and you will come across a number of freely available

Download the effect you want and you are all set

effects. Select and download the one that you like the best. Import the files and drag them to the timeline. Add new text and align it according to the effect. Go to effects transition and select linear wipe angle to 90 degree and the rest of the option according to the need and you will have a bunch of letters disappear into smoke in front of you.

Blender makes you do the same thing from scratch, but gives you more control while after effects makes it fast and easy to do.
