

Start something!

Starting off with editing multimedia or your own business, for that matter, has always been a daunting task, especially when you don't have an endless supply of funds. With this time's Digit bringing to light the entrepreneurial scene in India, it was only natural that our FastTrack be a guiding light to some of you who've been wanting to roll up your sleeves and get the wheels turning on your very own venture or a new hobby.

Multimedia editing isn't exactly a small place to start. For starters, an alarming number of Hollywood movies are outsourcing post-processing to India. So much so that every single big budget movie you've seen in the past year has spent quite a lot of time in some FX studio in our country. So there's a lot of work to be done and a lot of money to be made. Even if you indulge in multimedia editing as a hobby, you never know when a little hobby can slowly blossom into something bigger.

Like some other hobbies, multimedia editing can slowly rake up the costs. The software is by no means cheap, not to mention that these haven't been created in India so when you do wish to purchase a

license for just one of the many creative software suites available, you're going to burn through almost all of your budget. So our first step was to go through the innumerable open source alternatives available and put it through the grind. We've also tried out a few web-based tools and *free software* apart from strictly *opensource*. Though these tools aren't available for re-distribution or modification, you can legally get your hands on them for no cost and hence were worthy of covering for the purposes of this FastTrack.

“If you cannot do great things, do small things in a great way.”

- Napoleon Hill
